UTILITY PATENT APPLICATION TRANSMITTAL
FILED UNDER 37 C.F.R. §1.53(b)

Sir:

Transmitted herewith for filing is the patent application of:

Inventor(s):

Guy GECHT whose address is: 1003 Huntington Avenue, San Jose, CA 95129
and whose citizenship is: United States

Philip A. LODWICK whose address is: 7225 Garfield Avenue, Richfield, MN 55423
and whose citizenship is: United States

Loren SCHOENZEIT whose address is: 4480 Forest Lake Landing, Orono, MN 55364
and whose citizenship is: United States

John D. STEINBERG whose address is: 873 Hacienda Way, Millbrae, CA 94030
and whose citizenship is: United States

Ofer TENENBAUM whose address is: 3509 La Terrace Circle, San Jose, CA 94123
and whose citizenship is: Israel

Title: **METHODS AND SYSTEMS FOR THE PROVISION OF PRINTING SERVICES**

APPLICATION ELEMENTS:

- (1) ☒ Patent Application Specification, including Abstract and claims - 71 pages
- (2) ☒ Eleven (11) sheet(s) of formal drawings, together with transmittal letter
- (3) ☐ A check in the amount of \$ _____ to cover the ☐ filing fee(\$.00) and/or ☐ Assignment Recordal Fee (\$40) is enclosed.
- ☐ Before calculating the fee, cancel claim(s)
- ☐ Before calculating the fee, see copy of Preliminary Amendment filed in parent application _____ (attached hereto.)

09688457 10/16/00

Basic Fee							\$	710.00
Multiple Dependent Claims (\$260.)								
Foreign Language Surcharge (\$130.)								
	For	No. Filed	-	No. Extra		Rate		
EXTRA	Total Claims	108	20	88	x	\$18.	=	\$ 1584.00
CLAIMS	Independent Claims	2	3	0	x	\$80.	=	\$ 0.00
TOTAL FILING FEE							=	\$ 2294.00

- ☐ The Commissioner is hereby authorized to charge any deficiency in the payment of the required fee(s) or credit any overpayment to Deposit Account No. 50-0625.
- (4) ☐ Declaration and Power of Attorney form -- 3 pages
- a. ☐ Newly executed
- b. ☐ Copy from a prior application
- c. ☐ Deletion of inventor(s) -- signed statement attached deleting inventor(s) named in the prior application.
- (5) ☐ Small Entity Declaration
- a. ☐ Newly executed
- b. ☐ Copy from a prior application. Status still proper and desired.

ACCOMPANYING APPLICATION PARTS:

- (6) ☐ Assignment document
- a. ☐ Newly executed (with \$40.00 recordal fee) and separate transmittal Form PTO-1595
- b. ☐ Copy from a prior application
- (7) ☐ Preliminary Amendment
- (8) ☐ Certified Copy of Priority Document, together with separate transmittal letter
- (9) ☐ Information Disclosure Statement, together with PTO Form 1449 and copies of cited references
- (10) ☒ Return receipt postage prepaid postcard
- (11) ☒ Express Mail Certificate (Mailing Label No. EL 632260374 US)
- (12) ☐ Other:

- (13) [] If a **CONTINUING APPLICATION**, check appropriate box, and supply the requisite information below:

☐ Continuation ☐ Divisional ☐ Continuation-in-part (CIP)
of prior application no.:

Prior application information:

Examiner: _____ Group/Art Unit: _____

Status: _____

FOR CONTINUATION or DIVISIONAL APPLICATIONS only: The entire disclosure of the prior application, from which an oath or declaration is supplied under paragraph 4(b) above, is considered a part of the disclosure of the accompanying continuation or divisional application and is hereby incorporated by reference. The incorporation can only be relied upon when a portion has been inadvertently omitted from the submitted application parts.

- (14) [] Please amend the specification by inserting before the first line the sentence:
- (15) [] This application claims the benefit of _____ Patent Application No. _____ filed on _____.

**METHODS AND SYSTEMS FOR THE PROVISION OF PRINTING
SERVICES**

BACKGROUND OF THE INVENTION

5 The present invention relates to methods and systems
for providing printing services over a communications
network. In particular, the present invention enables a
user to obtain print jobs at an unspecified location
which may be remote from the source of the print job. A
spooling server is used to store a print job received via
10 the network from a print job source. A printer polling
device, which may be at a location remote from the print
job source, is capable of polling the spooling server via
the network to identify whether any print jobs associated
with the printer polling device are available for
15 printing at one or more associated printers. A fee can be
charged for the printing services provided.

As computer networks become more complex, the rate
at which network configurations change continues to
increase. Also, the increasingly frantic pace of the
20 typical business traveler who juggles documents on
multiple computers and is required to configure a
traveling laptop computer to integrate into various
changing networks makes it increasingly difficult to
reliably and efficiently print even a simple document.

For example, a business traveler in a hotel may wish to print to a printer that the hotel provides for such purposes. Under the current state of the art, the user must first obtain the network ID of the printer along
5 with some information about the type of printer. Then, a print driver for that specific printer must be installed on the user's computer, and the computer must be configured to connect to the printer. This may additionally involve configuring the computer to connect
10 to the host network.

Further, in many cases, it is desirable to be able to prepare a document for printing prior to having the information concerning the destination printer. For example, it may be desirable to print a document from a
15 mobile laptop connected via a wireless data connection while in transit to a meeting at a site the user has never visited before. Obtaining the information and configuring the laptop to be able to print to the printer becomes logistically infeasible.

20 These problems have typically been solved in the past by one of the following methods:

1. The document is e-mailed or otherwise transferred over a network to a computer already configured to print to the desired printer;

25 2. A portable computer is connected directly to the printer via a cable or infra-red, bypassing many of the

difficulties of configuring the computer to print to a network computer;

3. A portable printer is transported to the desired location; or

5 4. The document is faxed to a fax machine.

Printing methods relating to network and distributed printing are known in the prior art. Such systems require either a private network or foreknowledge of the destination of a print job. These prior art methods
10 comprise what is typically referred to as "push" technology (i.e. technology in which a print job is directed to a specific known destination or printer).

In addition to the need for efficiency and ease of use is the need for security when sending, storing, or
15 printing print jobs. Early in the life of the Internet, the need for securing an organization's local network from tampering, stealing, or vandalism by outsiders became very obvious. A type of gateway called a firewall was developed to meet this need. The firewall is designed
20 to be a single, well-controlled access point between the outside, global, or wide-area network and the inside, local-area network. By carefully restricting the types of network traffic and the destinations where that traffic can flow, the firewall can provide effective protection.

Specific "holes" in the firewall are created for each type of traffic that is allowed through the gateway in each direction. Most organizations, for example, allow e-mail traffic in and out from their e-mail server, as well as web page client access from inside the firewall to servers located outside of it.

Many types of access between machines commonly used on a local network are normally prevented from going through the firewall. Specifically, file sharing, remote log-in, printing, and various other network-administration types of protocols are typically not allowed to be transported outside the firewall.

Another aspect of the firewall is that it is almost always administratively controlled by a centralized authority for the organization that owns the local area network - commonly the management information services (MIS) department of a company. Normal users generally have to make special requests that are approved at the upper levels of management to get configuration changes in the firewall. In the interest of maintaining security, these changes are often limited to specific point-to-point exceptions or "holes" in the firewall.

It is desirable by many users to be able to print from a machine on one local area network to a printer located on a different local area network with the data

being transferred over a global network (e.g., the Internet) outside of the firewall of both local networks.

The current state of the art does have solutions for this problem. However, almost all of these solutions require the intervention of the firewall administrator. One example of a solution is the IPP - Internet Printing Protocol standard being promulgated by various vendors. This standard allows IPP-equipped printers to receive print jobs from remote clients over the Internet.

However, the installation and use of IPP requires that a specific IPP hole be opened in the firewall by the network administrator.

It would be advantageous to be able to provide methods and systems that allow a user to print to a perhaps yet unknown destination printer or printer pool in a reliable, efficient and secure manner without the disadvantages of the above-mentioned techniques.

It would be further advantageous to provide a printing system based on "pull" technology (i.e. technology which enables a print job to be printed upon request, where the print file is only delivered in response to said request). Such technology would enable a system that allows a user to print to a destination printer or printer pool that may be located anywhere, in a reliable, efficient, and secure manner without the disadvantages of the above-mentioned techniques.

It would be further advantageous to have a solution that allows secure, efficient and easy-to-configure inter-network printing through a gateway firewall without the intervention of the network administrator.

5 It would be still further advantageous to make such printing services available to a user for a fee.

The methods and systems of the present invention provide the foregoing and other advantages.

090943 101500

SUMMARY OF THE INVENTION

5 The present invention relates to methods and systems
for providing printing services over a communications
network. In particular, the present invention enables a
user to obtain print jobs at a location which may be
unspecified, and which may be remote from the source of
the print job. A spooling server is used to store a print
job received via the network from a print job source. A
printer polling device, which may be used at a location
10 remote from the source of the print job, is capable of
polling the spooling server via the network to identify
whether any print jobs associated with the printer
polling device are available for printing at one or more
printers associated with the polling device. A variety of
15 revenue models may be used for the printing services
provided.

In a preferred embodiment, printing services are
provided via a spooling server which is capable of
receiving and storing one or more print jobs from a print
20 job source via a network. A printer polling device is
provided which is capable of polling the spooling server
via the network to identify a print job associated with
the printer polling device.

25 The print job can originate from any suitable print
job source, such as a client device with an associated

print driver, a web browser, a facsimile machine, a scanner, a telephone, an Internet appliance, a personal digital assistant, or the like. A print job can also originate on the spooling server itself or be obtained from another server. The client device may be a computer, a telephone, a personal digital assistant, an Internet appliance, or the like.

The identified print job can be transmitted from the spooling server to the printer polling device and printed at one or more printers coupled to the printer polling device.

The printer polling device may periodically poll the spooling server to identify a print job associated with the printer polling device.

The network may comprise at least one of a local area network, a wide area network, a global network, the Internet, and any other type of network. The network may consist of multiple interconnected networks having multiple gateways and other features as is well known in the art.

In an alternate embodiment, the printer polling device may be located within a gateway firewall and the spooling server may be located outside the gateway firewall. The print job may be forwarded to the spooling server such that reconfiguration of the gateway firewall is not required. For example, the print job may be

forwarded to the spooling server as web-style traffic and received at the printer polling device as web-style traffic.

The print job source may be located at and in communication with a first local area network and the printer polling device may be located at and in communication with a second local area network. The spooling server may be located outside of the first and second local area networks. The print job source may communicate with the spooling server via a first gateway firewall which controls access to the first local area network and the printer polling device may communicate with the spooling server via a second gateway firewall which controls access to the second local area network.

The printer polling device may be: (i) a stand-alone device connected to one or more printers via a standard printer port, (ii) integrated into the firmware of a printer, (iii) integrated into the software of a network print server, or (iv) of any other suitable configuration.

In an illustrative embodiment, a fee may be charged to access the spooling server. The fee can be based on one of print job size in bytes, print job size in number of pages, print job type, time for printing, time for storage, monthly fee, per use fee, lifetime membership, monthly membership, use of color, use of black and white,

page size, location, convenience, number of images, print quality, image quality, or other suitable factors. The fee may be charged for providing a print job to the spooling server and/or retrieving a print job from the spooling server. The fee can be paid via a client device associated with the print job source, the printer polling device, or other suitable device, such as a smart card, a telephone, a personal digital assistant, or the like.

In another illustrative embodiment, one or more of the print job source application software, spooling server, and printer polling device may be sold, licensed, leased, rented, or distributed freely for revenue generating purposes. The print job source application software, spooling server, and printer polling device may be owned and/or operated by the same entity, or by different entities.

Print job source application software may be distributed to end users on a royalty-bearing or royalty-free basis, and the end user may be charged a fee for each print job submitted to a spooling server, and/or for each job retrieved from a spooling server.

The spooling server may be sold, rented, licensed or distributed freely to a print server provider. The print server provider may be, for example, a corporation, university, government agency, or other similar entity. The print server provider may provide services to end

users for a fee for providing a print job to the spooling server and/or retrieving a print job from the spooling server.

5 The printer polling device may be sold, rented, licensed or distributed freely. Printer polling devices may be provided for customer use at coffee shops, hotels, airports, libraries, bookstores, post offices, supermarkets, kiosks, print shops, retail outlets, or other suitable locations. End users of the printer
10 polling device may be charged a fee for using the device.

The spooling server may store the one or more print job(s) in at least one spooling queue.

The print job may be encrypted at the print job source and decrypted at the printer polling device.

15 The print job may comprise a document provided by a content provider. The content provider may be one of a newspaper, a magazine, a periodical, a document provider, a graphic arts provider, a notification service, an Internet content provider, a merchant, a financial
20 institution, a government agency, a shipping company, or the like.

The print job may be provided by the content provider on a subscription basis. A single print job may be provided by the content provider for printing by
25 multiple users.

The printer polling device may comprise a user interface, a connection to the network, and a connection to one or more printers.

In a further embodiment, each print job may be stored on the spooling server according to a personal identification number (PIN). The spooling server may communicate to the printer polling device a list of print jobs associated with the PIN which are stored at the spooling server. The selection of a print job from the list may be provided for (e.g., via a user interface).

A plurality of print jobs may be stored on the spooling server according to the PIN. The PIN may be provided to the spooling server via one of a user interface associated with the printer polling device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, a dedicated terminal, or the like. The list of available print jobs may be displayed on one of a user interface associated with the printer polling device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, a dedicated terminal, or the like. Selection of an available print job may be made via a user interface associated with the printer polling device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a

personal digital assistant device, a dedicated terminal, or the like.

The printer polling device may be a portable device. The printer polling device may be operably associated
5 with a variety of printer types.

In a further embodiment, the print job may be provided to the spooling server without a pre-determined print destination. Alternatively, a desired print
10 location for the print job may be designated at the print job source. The designated print location may be communicated to the spooling server with the print job. The print job may be printed at the desired print location when the printer polling device at the desired print location polls the spooling server and identifies
15 the print job.

Further, a substantially specific time for printing a print job may be designated such that the print job is only available for printing from the spooling server at the designated substantially specific time.

20 In addition, a lifetime of the print job may be designated, wherein said print job will be stored on the spooling server only for the designated lifetime.

A number of printings of the print job may be designated, wherein the print job can only be printed the
25 designated number of times.

A list of recipients authorized to retrieve a print job may be designated, wherein the print job may only be printed by the designated recipients.

The print job may be one of a negotiable instrument, a stamp, a coupon, a certificate, a check, a unit of currency, a token, a receipt, or the like.

The print job source may be connected to the network using Dynamic Host Configuration Protocol (DHCP protocol), or any other suitable network configuration protocol. Similarly, the printer polling device may be connected to the network using DHCP protocol, or any other suitable network configuration protocol.

In a preferred embodiment, the printer polling device is capable of communicating printer status to the spooling server. The printer status may comprise at least one of a printer ready indication, an on-line indication, toner level information, paper supply information, error information, or other appropriate status information.

A printer operator can be notified when the printer status indicates that a printer requires attention. The operator can also be provided with vendor contact information to facilitate obtaining printer supplies or service. Automatic on-line ordering of printer supplies as required by printer status can be provided (e.g., by the spooling sever contacting predetermined preferred vendors).

whether the spooling server requires a document identified in the directory to complete a print job.

Communications with the spooling server may be enabled via at least one of a telephone, a personal digital assistant device, a computer, an Internet appliance, a web browser, a dedicated terminal, or the like. The communications with the spooling server may be via an audio interface or a visual interface.

A communication device for providing status of the print job stored on the spooling server may be provided. The status of the print job may comprise at least one of filename, file size, author, creation date, print job lifetime, image, title, contents, personal identification number, recipient, job number, or reference number. The communication device may be a telephone, a computer, an Internet appliance, a personal digital assistant device, a dedicated terminal, or any other suitable wireless or wired communication device.

The print job source may be one of a computer, a personal digital assistant device, an Internet appliance, a facsimile machine, a scanner, a telephone, a dedicated terminal, or other suitable source.

The printer polling device may be capable of polling multiple spooling servers.

The spooling server may be capable of communicating with other servers and receiving a print job from at least one of the other servers.

Figure 11 is a block diagram of an embodiment of an agent program.

DETAILED DESCRIPTION OF THE INVENTION

5 The present invention enables print jobs to be sent
to a spooling server for storage. The print jobs are
subsequently delivered to one or more printers, on
request, via a printer polling device. The printer
polling device uses "pull" technology, which polls the
spooling server so that the spooling server does not have
to initiate a connection into a printer. In this manner
print jobs can be securely printed anywhere, either
10 automatically or at the request of a user who is
authorized by the printer polling device and/or the
spooling server. Since the spooling server need not
initiate contact with any device, there is no potential
breach of firewall security in a local network
15 environment.

In one embodiment, a portable printer polling device
is provided to enable retrieval and printing of documents
from any location having Internet access and a printer.
The spooling server functions as a repository that is
20 accessible, e.g., via a global communication network such
as the Internet, to authorized users at any time of day.
Since the printer polling device polls the spooling
server in order to obtain delivery of a print job, prior
art push data flow techniques, which could compromise a
25 local area network's security, are avoided. Moreover,

compatibility with virtually all printers that may be connected to the network is provided, so that a document can be printed anywhere regardless of a specific printer's requirements. Many other advantages and
5 features of the invention are set forth in the following description.

An illustrative embodiment of the invention is shown in Figure 1. Printing services are provided via a spooling server 50 which is capable of receiving and
10 storing one or more print jobs from a print job source 10 via a network 110. A printer polling device 100 is provided which is capable of polling the spooling server 50 via the network 110 to identify a print job associated with the printer polling device 100. Configuration
15 problems are eliminated as each print job source 10 only needs to be configured to know how to print to the spooling server 50. The spooling server 50 only needs to be configured to be able to print to the printer polling device 100.

20 The print job can originate from any suitable print job source 10. As shown in Figure 1, the print job source 10 may be a client device 12 associated with print driver 14. The print driver 14 may receive the print job from an originating application 15, which can be any program
25 capable of producing a printable document. The print job source 10 may also be a web browser, a facsimile machine,

a scanner, a telephone, an Internet appliance, a personal digital assistant, or the like. A print job can also originate on the spooling server 50 itself or be obtained from another server. The client device 12 may be a
5 computer, a telephone, a personal digital assistant, an Internet appliance, a facsimile machine, a scanner, or the like.

The identified print job can be transmitted from the spooling server 50 to the printer polling device 100 and
10 printed at a printer 120 coupled to the printer polling device 100. Printer 120 may be a single printer or a pool of one or more printers coupled via a print server.

The printer polling device 100 may periodically poll the spooling server 50 to identify a print job associated
15 with the printer polling device 100. Security is achieved by the fact that the printer 120 is not passively accepting any and all connections from the outside. The printer polling device 100 is initiating connections to a specific, trusted location, the spooling server 50.

The network 110 may comprise at least one of a local
20 area network, a wide area network, a global network, the Internet, and any other type of network. The network 110 may consist of multiple interconnected networks having multiple gateways and other features as is well known in
25 the art.

In an alternate embodiment, the printer polling device 100 may be located within a gateway firewall 70 and the spooling server may be located outside the gateway firewall 70. In addition, the print job source 10
5 may be located within a gateway firewall 30 and the spooling server may be located outside the gateway firewall 30.

The print job may be forwarded to and from the spooling server 50 such that reconfiguration of gateway
10 firewalls 30 and 70 is not required. For example, the print job may be forwarded to the spooling server 50 as web-style traffic and received at the printer polling device 100 as web-style traffic. For example, a print driver 14 may accept print requests from application 15
15 like any other print driver, but instead of routing the print requests onto the network 110 using normal printer packets and well-known-ports, it routes the output of the print job to the spooling server 50 located outside of the firewall 30 using packets and ports that resemble web
20 traffic.

Similarly, using web types of packets and ports, the printer polling device 100 is capable of polling the spooling server 50 and retrieving any print jobs that have been stored for the printer 120.

25 As shown in Figure 1, the print job source 10 may be located at and in communication with a first local area

network 20 and the printer polling device 100 may be located at and in communication with a second local area network 80. The spooling server 50 may be located outside of the first and second local area networks 20, 80. The
5 print job source 10 may communicate with the spooling server 50 via a first gateway firewall 30 which controls access to the first local area network 20 and the printer polling device 100 may communicate with the spooling server 50 via a second gateway firewall 70 which controls
10 access to the second local area network 80.

The printer polling device 100 may be: (i) a stand-alone device connected to the printer 120 via a standard printer port, (ii) integrated into the firmware of the printer 120, (iii) integrated into the software of a
15 network print server, or (iv) of any other suitable configuration. The printer polling function may also be integrated into the software on a stand-alone print server such as those manufactured by Electronics for Imaging, Inc. (Foster City, California) under the
20 trademarks Fiery® and EDOX®.

In a preferred embodiment, a fee may be charged to access the spooling server 50. The fee can be based on one of print job size in bytes, print job size in number of pages, print job type, time for printing, time for
25 storage, monthly fee, per use fee, lifetime membership, monthly membership, use of color, use of black and white,

page size, location, convenience, number of images, print quality, image quality, or other suitable factors. The fee may be charged for providing a print job to the spooling server 50 and/or retrieving a print job from the spooling server 50. The fee can be paid via a client device 12 associated with the print job source 10, the printer polling device 100, or any other suitable device capable of communicating with the spooling server, such as a smart card, a telephone, a personal digital assistant, or the like.

The spooling server 50 may store the one or more print job(s) in at least one spooling queue 52. The spooling server 50 may be maintained by a trusted party on the outside of the firewalls 30, 70. Alternatively, the spooling server 50 may be owned and maintained by the organizations desiring to utilize inter-network printing.

Since the communications amongst the print job source 10, the spooling server 50, and the printer polling device 100 may travel across public networks, it is very desirable to protect any proprietary or confidential information that may be embodied in the print jobs.

In a preferred embodiment, the print job may be encrypted at the print job source 10 and decrypted at the printer polling device 100. For example, the print job can be encrypted on the client device 12 such that it can

only be printed by a person with the correct decryption key. In addition, printing of the document can be delayed until the key is physically entered at the printer polling device 100 (e.g., the recipient is physically present at the printer 120).

A flow diagram of an example of an encryption process used between the print job source 10, the spooling server 50 and the printer polling device 100 is shown in Figure 2. The print job 11 is protected by encrypting the print job (indicated at 501) at the print job source 10 (e.g., on the print driver 14 or an agent program on the originating client device 12 of Figure 1) and decrypting it at the spooling server 50. The encryption algorithm may be the IDEA algorithm. Other suitable encryption algorithms which can be utilized are DES (the Data Encryption Standard), or triple-DES (DES applied to the data three times with three different keys). Other encryption algorithms suitable for commercial confidential information are numerous and well known in the art of data encryption.

The key 500 used for encryption 501 may be derived from an account number 510, a user's secret PIN (personal identification number) 520, and/or optionally some additional encryption key digits 530 supplied by the user. Simply concatenating the bits together from these sources provides a moderately secure key 500. Optionally,

additional security may be achieved by using a more sophisticated hashing function.

5 The key 500 would be known only to the user and to the secure, trusted, spooling web server 50. The encrypted print job is sent to the spooling server 50 where it is decrypted (601) to facilitate reformatting 602 for the destination printer once it is known. The reformatted print job data is re-encrypted 603 using the same or similar key 500' derived in the same manner as 10 key 500 at the print job source 10. The encrypted print job is then transmitted from the spooling server 50 to the printer polling device 100. Once at the printer polling device 100, the print job is decrypted 701 using a key 500'' derived from the PIN 520, account number 510, and/or optional encryption key extension digits 530. 15 The decrypted print job can then be forwarded to the printer 120 for printing.

20 The print job 11 may comprise a document provided by a content provider. The content provider may be one of a newspaper, a magazine, a periodical, a document provider, a graphic arts provider, a notification service, an Internet content provider, a merchant, a financial institution, a government agency, a shipping company, or the like. For example, instead of physically delivering 25 the daily sports page, it is simply printed on a customer's home printer.

The print job 11 may be provided by the content provider on a subscription basis. A single print job may be provided by the content provider for printing by multiple users.

5 The printer polling device 100 may comprise a user interface, a connection to the network 110, and a connection to the printer 120. Figure 3 shows an embodiment of a user interface 103 for the printer polling device 100 having a display 101 and a keypad 102.
10 The keypad 102 shown in Figure 3 may also comprise an alphanumeric keypad to allow for entry of both letters and numbers. The user interface may optionally include a speaker and a microphone for audio output and input, and may also include a card reader for reading a magnetic
15 strip on a credit or debit card, automated teller machine (ATM) card, smartcard, prepaid print card, or the like.

 In a further embodiment as shown in Figure 4, each print job may be stored on the spooling server 50 according to a personal identification number (PIN) 400.
20 As an example, Figure 4 shows the PIN 400 entered at a client device 12. The PIN 400 is forwarded to the spooling server 50 by the print driver 14 along with the print job. The spooling server 50 may communicate to the printer polling device 100 a list of print jobs
25 associated with the PIN 400 which are stored at the spooling server 50. The selection of a print job from the

list may be provided for (e.g., via a user interface). For example, a small terminal may be provided at each printer polling device 100 to allow a user to interact with the spooling server 50 and request that the user's print jobs be sent to the printer 120 at the user's location. The user may identify himself or herself at the printer polling device 100 with their PIN 400, and the spooling server 50 can then match that PIN 400 with print jobs previously submitted using that same PIN 400.

A plurality of print jobs may be stored on the spooling server 50 according to the PIN 400 (e.g., in spooling queue 52). For example, a directory may be created for each user, and thus each PIN, registered with the spooling server 50. Each print job may additionally be assigned a unique job number at the time it is first received at the spooling server 50. Thereafter, the job number may be used to access the data files associated with that job unambiguously. Once a print job has been selected to be printed to a destination printer 120, the job number for the print job may be entered into a queue associated with the destination printer 120. Data structures suitable for maintaining a queue are well known in the art. In the preferred embodiment, the queue 52 is maintained in a C++ class known as a CList provided by Microsoft in their C++ class library.

When the printer polling device 100 polls the spooling server 50, the spooling server 50 checks to see if the queue for that printer 120 contains any print jobs. When the spooling server 50 finds a print job waiting to be printed, the data for that print job is retrieved from the file system, reformatted in a form suitable for the identified printer 120, and transmitted to the printer polling device 100.

The PIN 400 may be provided to the spooling server 50 via one of a user interface associated with the printer polling device 100, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, a dedicated terminal, or the like. The list of available print jobs may be displayed on one of a user interface associated with the printer polling device 100, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, a dedicated terminal, or the like. Selection of an available print job may be made via a user interface associated with the printer polling device 100, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, a dedicated terminal, or the like.

Figure 5 illustrates an exemplary process of authentication of a user using a PIN. When a user desires

to access their account or documents over a non-secure channel, first, the spooling server 50 needs to verify that it is indeed talking to the actual user. The server generates a random string of bits 350. These bits are sent to the printer polling device 100 where authentication is to take place. The user's PIN 150 is used to generate an encryption key 152 for encrypting the bits (indicated at 155) and the result is returned to the spooling server 50. The spooling server 50 decrypts the string (indicated at 355) using an encryption key 362 generated from the PIN it knows (360) and compares it to the original random string (indicated at 365). If the decrypted string 358 matches the original string 350, the spooling server 50 accepts the user as authenticated. An account number (361, 151) may optionally be used (either alone or in connection with the PIN) to generate the encryption keys 362, 152. Many other authentication protocols are well known in the art and may be substituted for the protocol described above in connection with Figure 5.

The printer polling device 100 may be a portable device. The printer polling device 100 may be operably associated with a variety of printer types.

In a further embodiment, the print job may be provided to the spooling server 50 without a pre-determined print destination. A user is able to interact

with the printer polling device 100 and communicate the identification of the desired print destination for the user's print job to the spooling server 50. The user need not know anything more about the printer 120 than its location (which the user needs anyway to be able to retrieve the physical output pages).

Alternatively, a desired print location for the print job may be designated at the print job source 10. The designated print location may be communicated to the spooling server 50 with the print job. The print job may be printed at the desired print location when the printer polling device 100 at the desired print location polls the spooling server 50 and identifies the print job.

Further, a substantially specific time for printing a print job may be designated such that the print job is only available for printing from the spooling server 50 at the designated substantially specific time.

In addition, a lifetime of the print job may be designated, wherein said print job will be stored on the spooling server 50 only for the designated lifetime.

A number of printings of the print job may be designated, wherein the print job can only be printed from the spooling server 50 the designated number of times.

A list of recipients authorized to retrieve a print job may be designated, wherein the print job may only be

printed by the designated recipients. For example, a document or series of documents may be provided to the spooling server 50 which document or documents can be received by a designated group of recipients, such as a company's sales force, newsgroup or other content subscribers, or other target audiences.

The print job may be one of a negotiable instrument, a stamp, a coupon, a certificate, a check, a unit of currency, a token, a receipt, or the like. In such circumstances, it may be desirable that the designated number of printings is one.

The print job source 10 may be connected to the network 110 using Dynamic Host Configuration Protocol (DHCP protocol), or any other suitable network configuration protocol. Similarly, the printer polling device 100 may be connected to the network 110 using DHCP protocol, or any other suitable network configuration protocol.

DHCP is a protocol which allows nodes to be added to a TCP/IP network dynamically without specific prior configuration of that node in the domain controller's hosts database. Each node desiring to connect announces itself to the DHCP server. The name of the node is sent to the DHCP server. The DHCP server then assigns the node a dynamic IP address as well as communicating the IP addresses of other key network services such as name

servers, mailhosts, and gateways that are available. Once setup and enabled, this mechanism allows nodes to be added to the network without the intervention of a network administrator.

5 Ease of installation and configuration is therefore achieved through the use of DHCP by the fact that most local networks are configured to allow network devices to be added without the intervention of an administrator using DHCP. In addition, most local networks allow web
10 access through their firewall (e.g., gateway firewalls 30 and 70). These two factors allow both the print job source 10 and the printer polling device 100 to connect and communicate to the spooling server 50 without the intervention of a network administrator. The user simply
15 plugs in the printer polling device 100 and it accesses the network and starts polling the spooling server 50.

 The invention may also be implemented using a virtual private network (VPN). A VPN is a mechanism that allows network nodes not directly connected to a local private
20 network to behave as if they are locally connected to the network by forwarding the data packets through some type of public or intermediate network. For security, authentication of the node desiring to connect to the network is performed, as well as encryption of the
25 contents of the forwarded packets. Various commercial products allow the setup and configuration of VPN's

[illegible]

5

15

20

25

bill of lading, a lottery or gaming ticket, a token, food stamps, a license, a permit, a pass, a passport, a ballot, a citation, identification, a copy-protection key, a proof-of-purchase, a warranty, a receipt, a transcript, a library card, or any other printable subject matter.

As illustrated in Figure 6, the printer polling device 100 may periodically poll the spooling server 50. The interval of the polling can vary as desired and can be adjusted dynamically based upon such factors as traffic or requests for files. The polling request (query) 210 is preferably encrypted. Because the query 210 is directed to a specific spooling server 50, it is difficult for a third party to breach the system's security. The query 210 asks the spooling server 50 if it has a print job identified by the user (e.g., via a PIN or a job number). Once the spooling server 50 has received a request 210 from the printer polling device 100 for a print job that is stored at the spooling server 50, the spooling server 50 waits for the next query 210 from the printer polling device 100. Then, instead of its normal answer to the query of "NACK" (negative acknowledge) 220, the spooling server 50 answers "ACK" (acknowledge) 230 and transmits the print job to the destination printer 120.

example, or files that have been made into a print job (Postscript or PDF file) by printing "to a file" from some application.

5 The directory 204 can be communicated to the printer polling device 100 and presented at the printer polling device 100. Selection of a print job 11 from the directory can be made (e.g., via a user interface).

10 For example, the spooling server 50 will list those documents 13 being available from the agent program 200 whenever the user of that account is interacting with the printer polling device 100, or any other interface provided for communication to the spooling server 50 as described herein.

15 For example, the agent program 200 may periodically poll the spooling server 50 via polling interface 202. The interval of the polling can vary as desired and can be adjusted dynamically based upon such factors as traffic or requests for files. The communications between the agent program 200 and the spooling server 50 occur
20 substantially as described in connection with Figure 6 above. The polling request (query) 206 is preferably encrypted. Because the query 206 is directed to a specific spooling server 50, it is difficult for a third party to breach the system's security. The query 206 asks
25 the spooling server 50 if it wants any files in the directory 204 (and may also update the directory 204).

Once the spooling server 50 has received a request 207 from the printer polling device 100 for a document that is listed in the directory 204, the spooling server 50 waits for the next query 206 from the agent program 200. Then, instead of its normal answer to the query of "NACK" (negative acknowledge), it answers "ACK" (acknowledge) followed by document information, such as the name of the document that is requested by request 207.

The agent program 200, upon receiving an "ACK" and the request information 207, opens the document 13 using the application it was created in and prints it to a temporary file 205 to create a print job 11. This print job 11 is then transmitted to the spooling server 50 via transmitter 203. The spooling server 50 uses its normal mechanism to then transmit the print job 11 to the destination printer 120.

Alternatively, the spooling server 50 may send an "ACK" followed by the name of a subdirectory. In that case, the agent program 200 returns the contents of that subdirectory. The spooling server 50 can then display those files to the user at the printer polling device 100 and allow one of the files to be selected, or allow additional navigation of directory 204 to take place.

The directory 204 may be presented via a visual presentation or an audio presentation. The client device 12 may periodically poll the spooling server 50 to

determine whether the spooling server 50 requires a document from the directory 204 to complete a print job.

Communications with the spooling server 50 may be enabled via at least one of a telephone, a personal digital assistant device, a computer, an Internet appliance, a web browser, a dedicated terminal, or the like. The communications with the spooling server 50 may be via an audio interface or a visual interface.

A communication device for providing status of the print job stored on the spooling server 50 may be provided. The status of the print job may comprise at least one of filename, file size, author, creation date, print job lifetime, image, title, contents, personal identification number, recipient, job number, or reference number. The communication device may be a telephone, a computer, an Internet appliance, a personal digital assistant device, a dedicated terminal, or any other suitable wireless or wired communication device.

The print job source 10 may be one of a computer, a personal digital assistant device, an Internet appliance, a telephone, a facsimile machine, a scanner, a dedicated terminal, or other suitable source.

The printer polling device 100 may be capable of polling multiple spooling servers.

The spooling server 50 may be capable of communicating with other servers and receiving a print job from at least one of the other servers.

The print jobs submitted from the print job source 10 to the spooling server 50 may be generated in a page description language known as Postscript. Alternate choices for a page description language are PDF, Latex, or other similar languages. The size of the paper, various printer capabilities, and printable area dimensions may be assumed from a lowest common denominator set of capabilities common to most of the intended target printers.

Once the destination printer 120 is known, the page description language data needs to be converted into a form that can be understood by that printer 120. This process is shown in Figure 7. Once the print job 11 is sent to the spooling server 50, a target printer 120 must be identified before the spooling server 50 can forward the print job 11 to be printed. Target printer identification 801 can be provided with the print job 11 from the print job source 10 or can be provided by the printer polling device 100 as part of the polling query. The spooling server 50 retrieves printer specific information 805 for the target printer 120 from a printer database 803. Based on the printer specific information 805 (such as data type, page dimensions, color

capabilities, margins, and other print characteristics)
the spooling server 50 will make printer specific
adjustments 810 to the print job 11 at the page
description language level prior to rasterization.

5 On printers that can accept Postscript (or the PDL
of choice) directly, no modification is necessary. For
other, simpler printers, a lower level bitmap form of the
page is required to be sent to the printer. In this case,
the page description language needs to be rasterized into
10 a bitmap form. In addition, the bitmap data needs to be
formatted into the form understood by the printer 120. A
raster image processor 815 determines the target printer
type from the printer specific information 805 and
selects an appropriate data format from available formats
15 820, 821, 822, 823. The raster image processor 815 places
the print job 11 into a printer specific data file 850
for delivery to the printer polling device 100 to be
printed at the target printer 120.

20 One common example of a data format used with simple
printers is PCL (Printer Control Language), which is
widely used in printers built by Hewlett Packard. Other
printers built by Epson, for example use Epson's
proprietary Epson-escape code sequences to format the
bitmap data.

Alternatively, reformatting of the print job may take place at the printer 120, at the printer polling device 100, or at any other suitable device.

Figure 8 shows the components of an embodiment of a printer polling device 100. As discussed above in connection with Figure 3, the printer polling device may optionally include a user interface 103 for enabling communications with the spooling server 50 (e.g., providing a PIN to the spooling server 50). A polling transmitter 105 is provided for transmitting polling requests to the spooling server 50 via the network 110 to identify a print job stored at the spooling server 50 (as discussed in connection with Figures 1 and 4 above). A print job receiver 108 is provided for receiving the identified print job from the spooling server 50 via the network 110. Decryption 111 of an encrypted print job may optionally be provided for at the printer polling device 100. A printer interface 112 enables the printer polling device 100 to forward the print job to a printer 120 for printing.

Figure 9 shows the components of an embodiment of a spooling server 50. A receiver 51 is provided which is capable of receiving print jobs from the print job source 10 and receiving polling requests from the printer polling device 100. The receiver 51 may comprise a print job receiver 58 for receiving the print job and a polling

receiver 59 for receiving the polling request. When a print job is received by the receiver 51, the spooling server 50 stores the print job in memory 52, which may comprise random access memory (RAM), magnetic or optical storage media, or any other read/write memory device. As discussed herein, the print jobs may be stored in memory 52 according to a PIN. Multiple print jobs may be stored under each PIN as shown at 53, 54, and 55. When the spooling server 50 receives a polling request for a specific print job from the printer polling device 100 at the receiver 51, the spooling server 50 will determine whether the requested print job is stored in memory 52, and if so, forward the requested print job to the printer polling device 100 via transmitter 57. A processor 56 enables the spooling server to search for, retrieve, and/or reformat the print job for delivery to the printer polling device 100.

Figure 10 shows the components of an embodiment of a print driver 14. An interface 16 is provided for receiving a print job from a print job source 10. The print job source 10 is shown in Figure 10 as a client device 12, but can be any suitable print job source as discussed herein. The interface 16 receives a printable document 13 from the client device 12. A transmitter 18 is provided for transmitting the print job 11 to the spooling server 50 via the network 110. The spooling

server 50 receives polling requests from the printer
polling device 100 and forwards one or more identified
print jobs to the printer polling device 100 in response
to the polling requests. The print jobs can then be
5 printed at a printer 120 associated with the printer
polling device 100. As discussed in greater detail
elsewhere herein, the printer polling device 100 does not
have to identify specific print jobs to the spooling
server 50. Instead, it can simply request a list of all
10 print jobs (if any) currently stored at the spooling
server 50 for that specific printer polling device 100,
or for a particular PIN number (or other identifier)
entered via the printer polling device 100 or other
device. As discussed elsewhere herein, the list of print
15 jobs may be accessed via various other devices capable of
communicating with the spooling server 50.

It will now be appreciated that the present
invention provides improved methods and systems for
providing printing services over a communications network
20 in a secure manner without the need to specify the print
destination. By using a printer polling device, the
disadvantages of prior art push data flow techniques are
overcome. Instead of having a remote device initiate
contact with a print station behind a firewall, the
25 present invention provides a printer polling device that
polls a spooling server to determine if there are any

documents to be printed by a printer associated with the printer polling device. Compatibility with all types of printers is also provided.

5 Although the invention has been described in connection with preferred embodiments thereof, those skilled in the art will appreciate that numerous adaptations and modifications may be made thereto without departing from the spirit and scope of the invention, as set forth in the following claims.

0968457 101600

What is claimed is:

1. A method of providing printing services, comprising:
 - providing a spooling server capable of receiving and storing one or more print jobs from a print job source via a network; and
 - providing a printer polling device capable of polling the spooling server via the network to identify a print job associated with the printer polling device.
2. A method in accordance with claim 1, further comprising:
 - transmitting an identified print job from the spooling server to the printer polling device; and
 - printing said identified print job at a printer coupled to the printer polling device.
3. A method in accordance with claim 1, wherein said printer polling device periodically polls the spooling server to identify a print job associated with the printer polling device.
4. A method in accordance with claim 1, wherein the network comprises:
 - at least one of a local area network, a wide area network, a global network, and the Internet.

003707 254936

5. A method in accordance with claim 1, wherein:
 said printer polling device is located within a gateway firewall; and
 said spooling server is located outside said gateway firewall.
6. A method in accordance with claim 5, wherein:
 the print job is forwarded to the spooling server as web-style traffic and received at the printer polling device as web-style traffic.
7. A method in accordance with claim 5, wherein:
 the print job is forwarded to the spooling server such that reconfiguration of the gateway firewall is not required.
8. A method in accordance with claim 1, wherein:
 the print job source is located at and in communication with a first local area network;
 the printer polling device is located at and in communication with a second local area network; and
 the spooling server is located outside of the first and second local area networks.
9. A method in accordance with claim 8, wherein:

the print job source communicates with the spooling server via a first gateway firewall which controls access to the first local area network; and

the printer polling device communicates with the spooling server via a second gateway firewall which controls access to the second local area network.

10. A method in accordance with claim 1, wherein the printer polling device is one of (i) a stand-alone device connected to the printer via a standard printer port, (ii) integrated into the firmware of the printer, or (iii) integrated into the software of a network print server.

11. A method in accordance with claim 1, further comprising:

charging a fee to access the spooling server.

12. A method in accordance with claim 11, wherein the fee is based on one of print job size in bytes, print job size in number of pages, print job type, time for printing, time for storage, monthly fee, per use fee, lifetime membership, monthly membership, use of color, use of black and white, page size, location, convenience, number of images, print quality, or image quality.

13. A method in accordance with claim 11, wherein:

the fee is charged for at least one of providing a print job to the spooling server and retrieving a print job from the spooling server.

14. A method in accordance with claim 11, wherein the fee can be paid via at least one of (i) a client device associated with the print job source; or (ii) the printer polling device.

15. A method in accordance with claim 1, wherein:

the spooling server stores the one or more print job(s) in at least one spooling queue.

16. A method in accordance with claim 1, further comprising:

providing for encryption of the print job at the print job source; and

providing for decryption of the print job at the printer polling device.

17. A method in accordance with claim 1, wherein the print job comprises a document provided by a content provider.

storing each print job on the spooling server
according to a personal identification number (PIN).

23. A method in accordance with claim 22, further comprising:

communicating from the spooling server to the printer polling device a list of print jobs associated with the PIN which are stored at the spooling server; and

providing for the selection of a print job.

24. A method in accordance with claim 22, further comprising:

storing a plurality of print jobs on the spooling server according to the PIN.

25. A method in accordance with claim 22, wherein:

the PIN is provided to the spooling server via one of a user interface associated with the printer polling device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, or a dedicated terminal;

the list of available print jobs is displayed on one of a user interface associated with the printer polling device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, or a dedicated terminal; and

selection of an available print job is made via a user interface associated with the printer polling

2025 RELEASE UNDER E.O. 14176

device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, or a dedicated terminal.

26. A method in accordance with claim 1, wherein the printer polling device is a portable device.

27. A method in accordance with claim 1, wherein the printer polling device may be operably associated with a variety of printer types.

28. A method in accordance with claim 1, wherein the print job is provided to the spooling server without a pre-determined print destination.

29. A method in accordance with claim 1, further comprising:

 providing for designation of a desired print location for the print job at the print job source;

 providing for communication of the desired print location to the spooling server; and

 printing the print job at the desired print location when the printer polling device at the desired print location polls the spooling server and identifies the print job.

2025 RELEASE UNDER E.O. 14176

34. A method in accordance with claim 1, further comprising:

providing for the designation of one or more recipients of said print job, wherein the print job can only be printed by the designated one or more recipients.

35. A method in accordance with claim 1, wherein the print job source is connected to the network using DHCP protocol.

36. A method in accordance with claim 1, wherein the printer polling device is connected to the network using DHCP protocol.

37. A method in accordance with claim 1, wherein the printer polling device communicates printer status to the spooling server.

38. A method in accordance with claim 37, wherein the printer status comprises at least one of a printer ready indication, an on-line indication, toner level information, paper supply information, or error information.

39. A method in accordance with claim 37, further comprising:

notifying a printer operator when said printer status indicates that the printer requires attention.

009101 1348960

uploading the document from the client device to the spooling server.

```
communicating the directory to the printer polling
device;
```

providing for selection of a print job from the directory.

46. A method in accordance with claim 43, wherein the client device periodically polls the spooling server.

52. A method in accordance with claim 1, wherein the print job source is one of a computer, a personal digital assistant device, an Internet appliance, a facsimile machine, a scanner, a telephone, or a dedicated terminal.

53. A method in accordance with claim 1, wherein said printer polling device is capable of polling multiple spooling servers.

54. A method in accordance with claim 1, further comprising:

providing for the communication between said spooling server and other servers; and

receiving a print job from at least one of the other servers at the spooling server.

55. A system for providing printing services, comprising:

a spooling server capable of receiving and storing one or more print jobs from a print job source via a network; and

a printer polling device capable of polling the spooling server via the network to identify a print job associated with the printer polling device.

56. A system in accordance with claim 55, wherein:

009707-434990

an identified print job is transmitted from the spooling server to the printer polling device; and
said identified print job is printed at a printer coupled to the printer polling device.

57. A system in accordance with claim 55, wherein said printer polling device periodically polls the spooling server to identify a print job associated with the printer polling device.

58. A system in accordance with claim 55, wherein the network comprises:

at least one of a local area network, a wide area network, a global network, and the Internet.

59. A system in accordance with claim 55, wherein:

said printer polling device is located within a gateway firewall; and

said spooling server is located outside said gateway firewall.

60. A system in accordance with claim 59, wherein:

the print job is forwarded to the spooling server as web-style traffic and received at the printer polling device as web-style traffic.

009404 294995

61. A system in accordance with claim 59, wherein:

the print job is forwarded to the spooling server such that reconfiguration of the gateway firewall is not required.

62. A system in accordance with claim 55, wherein:

the print job source is located at and in communication with a first local area network;

the printer polling device is located at and in communication with a second local area network; and

the spooling server is located outside of the first and second local area networks.

63. A system in accordance with claim 62, wherein:

the print job source communicates with the spooling server via a first gateway firewall which controls access to the first local area network; and

the printer polling device communicates with the spooling server via a second gateway firewall which controls access to the second local area network.

64. A system in accordance with claim 55, wherein the printer polling device is one of (i) a stand-alone device connected to the printer via a standard printer port, (ii) integrated into the firmware of the printer, or

05630437 101500

(iii) integrated into the software of a network print server.

65. A system in accordance with claim 55, wherein a fee is charged to access the spooling server.

66. A system in accordance with claim 65, wherein the fee is based on one of print job size in bytes, print job size in number of pages, print job type, time for printing, time for storage, monthly fee, per use fee, lifetime membership, monthly membership, use of color, use of black and white, page size, location, convenience, number of images, print quality, or image quality.

67. A system in accordance with claim 65, wherein:
the fee is charged for at least one of providing a print job to the spooling server and retrieving a print job from the spooling server.

68. A system in accordance with claim 65, wherein the fee can be paid via at least one of (i) a client device associated with the print job source; or (ii) the printer polling device.

69. A system in accordance with claim 55, wherein:

the spooling server stores the one or more print job(s) in at least one spooling queue.

70. A system in accordance with claim 55, further comprising:

an encryption device for encryption of the print job at the print job source; and

a decryption device for decryption of the print job at the printer polling device.

71. A system in accordance with claim 55, wherein the print job comprises a document provided by a content provider.

72. A system in accordance with claim 71, wherein said content provider is one of a newspaper, a magazine, a periodical, a document provider, a graphic arts provider, a notification service, an Internet content provider, a merchant, a financial institution, a government agency, or a shipping company.

73. A system in accordance with claim 71, wherein the print job is provided by the content provider on a subscription basis.

the PIN is provided to the spooling server via one of a user interface associated with the printer polling device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, or a dedicated terminal;

the list of available print jobs is displayed on one of a user interface associated with the printer polling device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, or a dedicated terminal; and

selection of an available print job is made via a user interface associated with the printer polling device, a telephone, a computer, an Internet appliance, a facsimile machine, a scanner, a personal digital assistant device, or a dedicated terminal.

80. A system in accordance with claim 55, wherein the printer polling device is a portable device.

81. A system in accordance with claim 55, wherein the printer polling device may be operably associated with a variety of printer types.

82. A system in accordance with claim 55, wherein the print job is provided to the spooling server without a pre-determined print destination.

83. A system in accordance with claim 55, wherein:

a desired print location for the print job is designated at the print job source;

the desired print location is communicated to the spooling server; and

the print job is printed at the desired print location when the printer polling device at the desired print location polls the spooling server and identifies the print job.

84. A system in accordance with claim 55, wherein:

a substantially specific time for printing a print job is designated; and

said print job is made available for printing from the spooling server only at the designated substantially specific time.

85. A system in accordance with claim 55, wherein:

a lifetime of the print job is designated, wherein said print job will be stored only for the designated lifetime.

86. A system in accordance with claim 55, wherein:

05689457 101600

91. A system in accordance with claim 55, wherein the printer polling device communicates printer status to the spooling server.

93. A system in accordance with claim 91, wherein:
a printer operator is notified when said printer
status indicates that the printer requires attention.

95. A system in accordance with claim 91, wherein:
automatic on-line ordering of printer supplies as
required by printer status is provided.

96. A system in accordance with claim 55, wherein the print job comprises at least one of a document, a poster, an image, a coupon, a ticket, a certificate, a check, a list, a schedule, a periodical, a unit of currency, a negotiable instrument, postage, a bill of lading, a lottery or gaming ticket, a token, food stamps, a license, a permit, a pass, a passport, a ballot, a

citation, identification, a copy-protection key, a proof-of-purchase, a warranty, a receipt, a transcript, or a library card.

97. A system in accordance with claim 55, further comprising:

an agent program that provides a directory of documents to the spooling server, said agent program enabling a client device associated with the print job source to poll the spooling server to determine whether the spooling server requires a document from the directory to complete a print job; wherein:

the document is uploaded from the client device to the spooling server.

98. A system in accordance with claim 97, wherein:

the directory is communicated to the printer polling device;

the directory is presented at the printer polling device; and

a print job can be selected from the directory.

99. A system in accordance with claim 98, wherein said directory is presented via one of a visual presentation or an audio presentation.

101. A system in accordance with claim 55, wherein communications with the spooling server are enabled via at least one of a telephone, a personal digital assistant device, a computer, an Internet appliance, a web browser, or a dedicated terminal.

103. A system in accordance with claim 55, further comprising:

104. A system in accordance with claim 103, wherein the status of the print job comprises at least one of filename, file size, author, creation date, print job lifetime, image, title, contents, personal identification number, recipient, job number, or reference number.

105. A system in accordance with claim 103, wherein the communication device comprises one of a telephone, a

106. A system in accordance with claim 55, wherein the print job source is one of a computer, a personal digital assistant device, an Internet appliance, a telephone, a facsimile machine, a scanner, or a dedicated terminal.

108. A system in accordance with claim 55, wherein:
 said spooling server is capable of communicating
with other servers; and
 said spooling server is capable of receiving a print
job from at least one of the other servers.

ABSTRACT

5 The present invention relates to methods and systems
for providing printing services over a communications
network. In particular, the present invention enables a
user to obtain print jobs at an unspecified location
which may be remote from the source of the print job. A
spooling server is used to store a print job received via
the network from a print job source. A printer polling
device, which may be at a location remote from the print
10 job source, is capable of polling the spooling server via
the network to identify whether any print jobs associated
with the printer polling device are available for
printing at an associated printer. The spooling server
need not initiate contact with the printer through a
15 firewall, since it is polled by the printer polling
device. Thus, network security is maintained. A fee can
be charged for the printing services provided.
